Month-3 Wishlist — Ranked

Oct 3, 2026 · @Aseel

The playbook's priority order for the Gate-2 wishlist, kept as given — awaiting lead sign-off.

1. **A second GNN method** — GNN embeddings + k-means, or MinCutPool, so the claim is about GNN community detection as a class, not just one algorithm (DMoN).
2. **DMoN without node features** — isolates how much of DMoN's advantage comes from reading node content vs. graph structure alone.
3. **Cluster-count sensitivity** — how results change as the target community count (C) varies.
4. **Hierarchy-construction choice** — test recursive DMoN vs. flat + Leiden-style rollup, the choice made by default in week 4.
5. **A third corpus** — a further replication beyond MuSiQue and 2WikiMultiHopQA.

Status: list written, pending lead sign-off on the order.
